Question 1: Congruent Triangles

Given two triangles ABC and DEF, with $AB \cong DE$, $BC \cong EF$, and $AC \cong DF$, prove that triangles ABC and DEF are congruent.

Solution:

- Since all three pairs of corresponding sides are congruent (SSS), by the Side-Side-Side Congruence Postulate, triangles ABC and DEF are congruent.
- This proof involves explicitly stating the SSS criteria and confirming the correspondence of sides.

Question 2: Coordinate Geometry

Find the length of the segment connecting points P(2, 3) and Q(5, 7).

Solution:

- Use the distance formula: $d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$
- Calculation: $d = \sqrt{(5 - 2)^2 + (7 - 3)^2} = \sqrt{3^2 + 4^2} = \sqrt{9 + 16} = \sqrt{25} = 5$

Tip: Memorize the distance formula and practice coordinate problems regularly.

Question 3: Circle Theorems

In a circle with center O, a tangent is drawn at point T. If OT is 4 units, and the radius OT is perpendicular to the tangent, find the length of the tangent segment from point T to a point P outside the circle, given that PT is 10 units.

Solution:

- Use the properties of tangents: the tangent segment from an external point P to the circle is equal in length regardless of the point chosen.
- Applying the Pythagorean theorem or the tangent-secant theorem, students can verify the lengths.

Note: This question tests understanding of circle-tangent relationships and the theorem stating that a tangent is perpendicular to the radius at the point of contact.

Sample Questions and Solutions from the January 2014 Exam

Question 1 (Multiple Choice):

In triangle ABC, if angle A measures 50° , and the exterior angle at C measures 70° , what is the measure of angle B?

Solution:

Using the exterior angle theorem:

Exterior angle at C = angle A + angle B

$$70^\circ = 50^\circ + \text{angle B}$$

$$\text{angle B} = 70^\circ - 50^\circ = 20^\circ$$

Answer: 20°

Question 2 (Short Answer):

Find the coordinates of the midpoint of segment AB, where A(2, 3) and B(8, 7).

Solution:

Midpoint formula:

$$\text{Midpoint } M = \left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2} \right)$$

$$M = \left(\frac{2 + 8}{2}, \frac{3 + 7}{2} \right) = (5, 5)$$

Answer: (5, 5)

Question 3 (Extended):

Given a circle with center O(0,0) and radius 5, find the coordinates of the point P on the circle such that the distance from P to (3,4) is minimized.

Solution:

The problem asks for the point P on the circle closest to (3,4). The shortest distance from a point to a circle occurs along the line connecting the point to the circle's center, with P lying on that line.

- Distance from center O to point (3,4):

$$\sqrt{(3-0)^2 + (4-0)^2} = \sqrt{9 + 16} = \sqrt{25} = 5$$

- Since the point (3,4) lies exactly on the circle (radius 5), the closest point P is the same as (3,4).

Answer: (3,4)

On the January 2014 Regents, you identify the center and radius from the problem and substitute into this formula to write the equation. What types of transformations are commonly tested in the January 2014 Geometry Regents? Common transformations include translations, rotations, reflections, and dilations. Questions often ask for the image of a figure after transformation or to identify the type of transformation based on the changes in the figure. How do you determine the measure of an interior angle of a polygon on the January 2014 Geometry Regents? The measure of each interior angle of a regular polygon is given by the formula: $[(n - 2) 180^\circ] / n$, where n is the number of sides. The January 2014 exam may require you to find the measure of an interior angle or the sum of interior angles of a polygon. What is the significance of similar triangles in the January 2014 Geometry Regents? Similar triangles have equal corresponding angles and proportional sides. The exam often includes problems where you use similarity to find missing side lengths or angles, especially in indirect measurement problems.
