The Handbook categorizes cast iron into several types based on microstructure and alloying elements, each suited for particular applications.

Types of Cast Iron Covered in the ASM Specialty Handbook

Understanding the different types of cast iron is fundamental to leveraging their properties

effectively. The ASM Handbook classifies cast iron into the following main categories:

Gray Cast Iron

Gray cast iron is the most common form, characterized by the presence of graphite flakes embedded in a ferritic or pearlitic matrix. Its name derives from the gray appearance of the fracture surface.

Main features include:

- Good machinability due to graphite flakes
- Excellent damping capacity
- Moderate tensile strength

Key properties:

- High tensile strength and ductility
- Superior toughness
- Good wear resistance

Common uses include crankshafts, gears, and heavy-duty piping.

White Cast Iron

White cast iron has cementite (iron carbide) as the primary microstructure, making it very hard and brittle.

Main features:

- High hardness and wear resistance

- Low ductility and impact resistance
- Uses in abrasion-resistant applications

Applications include liners and shot blast nozzles.

Malleable Cast Iron

Produced by heat-treating white cast iron, malleable cast iron offers improved ductility.

Properties:

- Good ductility and toughness

Applications include automotive suspension parts and heavy machinery components.

Microstructure and Mechanical Properties of Cast Iron

The ASM Specialty Handbook emphasizes that microstructure plays a pivotal role in defining cast iron's properties. The microstructure is influenced by alloy composition, cooling rate, and heat treatment processes.

Graphite Morphology

The shape and distribution of graphite significantly affect mechanical behavior:

- Flake graphite in gray cast iron leads to brittleness but excellent damping
- Spherical graphite in ductile cast iron imparts ductility and toughness
- Compacted graphite offers a balance between the two

Matrix Types

The matrix phase surrounding the graphite is typically ferritic, pearlitic, or martensitic:

- Ferritic matrix: provides ductility and good machinability
- Pearlitic matrix: offers higher strength and hardness
- Martensitic matrix: used in specialty applications requiring high hardness

Mechanical Properties Overview

Depending on the cast iron type and microstructure, properties vary:

- Tensile strength ranges from 150 MPa (gray cast iron) to over 550 MPa (compacted ductile iron)
- Hardness can vary from 100 HB (gray cast iron) to over 300 HB (white cast iron)
- Impact resistance is highest in ductile cast iron

The Handbook details how heat treatment, alloying additions (such as nickel, chromium, molybdenum), and microstructure control can optimize these properties for desired applications.
