Solution Approach:

Use $Q = mc\Delta T + C_{\text{calorimeter}} \Delta T$.

Students must recognize the components and perform calculations accurately.

- Application of Hess's Law

Example:

In-Depth Review of Key Concepts with Answers

1. Calculating Heat Transfer in Calorimetry

Question:

A 50.0 g sample of water is heated from 25°C to 75°C. How much heat energy is absorbed? (Specific heat capacity of water = 4.18 J/g°C)

Answer:

Using the formula:

$$q = mc\Delta T$$

where:

$$m = 50.0 \text{ g}$$

$$c = 4.18 \text{ J/g}^\circ\text{C}$$

$$\Delta T = 75^\circ\text{C} - 25^\circ\text{C} = 50^\circ\text{C}$$

Calculation:

$$q = 50.0 \text{ g} \times 4.18 \text{ J/g}^\circ\text{C} \times 50^\circ\text{C}$$

$$q = 50.0 \times 4.18 \times 50 = 10,450 \text{ J}$$

Result:

The water absorbs 10,450 Joules of heat energy.

2. Applying Hess's Law

Question:

Find ΔH for the reaction:

Answer:

Using Hess's Law, arrange the reactions to cancel out common terms:

From the second reaction:

Reversing it:

Now, add this to the first reaction:

Sum:

Simplify:

Total enthalpy change:

$$(-393.5 \text{ kJ} + 283 \text{ kJ}) = -110.5 \text{ kJ}$$

Result:

$\Delta H = -110.5 \text{ kJ}$ for the formation of CO from C and O_2 .

3. Bond Enthalpy Calculations

Question:

Calculate the approximate enthalpy change for the reaction:

Bond	Enthalpy (kJ/mol)
C-H	412
C=O	799

| O=O | 498 |

Answer:

Step 1: Break all bonds in reactants:

- 4 C-H bonds: $(4 \times 412 = 1648 \text{ kJ})$
- 2 O=O bonds: $(2 \times 498 = 996 \text{ kJ})$

Total energy to break bonds: $(1648 + 996 = 2644 \text{ kJ})$

Step 2: Form bonds in products:

- 2 C=O bonds in CO_2 : $(2 \times 799 = 1598 \text{ kJ})$
- 4 O-H bonds in $2 \text{ H}_2\text{O}$ molecules: $(4 \times 463 = 1852 \text{ kJ})$ (assuming O-H bond enthalpy is 463 kJ/mol)

Total energy released: $(1598 + 1852 = 3450 \text{ kJ})$

Step 3: Calculate (ΔH) :

$(\Delta H \approx \text{Energy to break} - \text{Energy to form} = 2644 - 3450 = -805 \text{ kJ})$

Result:

Approximate enthalpy change for the reaction is -805 kJ (exothermic).

CHAPTER 11 THERMOCHEMISTRY REVIEW ANSWER KEY

chapter 11 thermochemistry review answer key is an essential resource for students preparing for chemistry exams, especially those focusing on thermodynamics and energy changes in chemical reactions. Understanding the core concepts in thermochemistry helps students grasp how energy interacts with matter, how to calculate energy changes, and how to interpret data from experiments. This review guide provides detailed explanations, step-by-step solutions, and key concepts to reinforce learning and improve problem-solving skills.

Introduction to Thermochemistry

Thermochemistry is a branch of chemistry that deals with the study of heat transfer during chemical

reactions and physical changes. It explains how energy is exchanged between systems and surroundings, and how this transfer can be measured and predicted.

Key Concepts in Thermochemistry

- System and Surroundings: The system is the part of the universe under study, such as a chemical reaction. The surroundings encompass everything outside the system.
- Heat (q): Energy transferred due to a temperature difference.
- Work (w): Energy transfer due to force applied over a distance.
- Enthalpy (ΔH): The heat content of a system at constant pressure.

Understanding these concepts is crucial for analyzing thermochemistry problems and solving questions found in Chapter 11 review exercises.

Fundamental Principles of Thermochemistry

Thermochemistry relies on several foundational principles that help interpret experimental data and theoretical calculations.

Law of Conservation of Energy

- Energy cannot be created or destroyed, only transferred or converted from one form to another.
- In chemical reactions, the energy lost or gained by the system is reflected in the surroundings.

Endothermic and Exothermic Reactions

- Endothermic: Reactions that absorb heat from the surroundings ($\Delta H > 0$).
- Exothermic: Reactions that release heat into the surroundings ($\Delta H < 0$).

Measuring Enthalpy Changes

- Enthalpy changes are often measured using calorimetry.
- The heat change of a reaction is related to the temperature change of the surroundings, the calorimeter's heat capacity, and the reaction's stoichiometry.

Review of Chapter 11 Thermochemistry Problem Types

Understanding the types of problems typically encountered in Chapter 11 helps students prepare effectively. The review answer key provides solutions to these common questions:

1. Calculating Enthalpy Changes

- Using Hess's Law to determine ΔH for a reaction based on known enthalpy changes of related reactions.
- Applying the equation: $\Delta H = q_p$ (heat at constant pressure).

2. Using Calorimetry Data

- Calculating the heat absorbed or released during a physical or chemical change.
- Example: Using the formula $q = mc\Delta T$, where
 - m = mass of the substance,
 - c = specific heat capacity,
 - ΔT = temperature change.

3. Enthalpy of Formation

- Calculating ΔH°_f for a compound using standard enthalpies of formation.
- Applying the relationship: $\Delta H^\circ_{\text{reaction}} = \sum \Delta H^\circ_f (\text{products}) - \sum \Delta H^\circ_f (\text{reactants})$.

4. Bond Enthalpies

- Estimating ΔH for reactions using bond dissociation energies.
- The formula: $\Delta H \approx \sum (\text{bond energies of bonds broken}) - \sum (\text{bond energies of bonds formed})$.

Step-by-Step Solutions from the Answer Key

To reinforce understanding, here are detailed solutions to typical Chapter 11 thermochemistry problems:

Example 1: Calculating Heat Absorbed in a Reaction

Problem:

A 50 g sample of water is heated from 25°C to 80°C. Calculate the amount of heat absorbed.

Solution:

- Identify known variables:

- $m = 50 \text{ g}$

- $c = 4.18 \text{ J/g}^\circ\text{C}$ (specific heat capacity of water)

- $\Delta T = 80^\circ\text{C} - 25^\circ\text{C} = 55^\circ\text{C}$

- Apply the formula: $q = mc\Delta T$

$$q = 50 \text{ g} \times 4.18 \text{ J/g}^\circ\text{C} \times 55^\circ\text{C}$$

$$q = 50 \times 4.18 \times 55$$

$$q = 50 \times 229.9$$

$$q = 11,495 \text{ J}$$

Answer:

The water absorbs approximately 11,495 Joules of heat.

Example 2: Using Hess's Law to Find Enthalpy Change

Problem:

Given the following reactions:

Calculate the ΔH for the reaction:

Solution:

- Write the target reaction in terms of known reactions:

Target: $\text{CO} + \frac{1}{2}\text{O}_2 \rightarrow \text{CO}_2$

- Reverse reaction (2):

$\text{CO} \rightarrow \text{C} + \text{O}_2, \Delta H = +110.5 \text{ kJ}$

- Add reaction (1) and the reversed (2):

$\text{C} + \text{O}_2 \rightarrow \text{CO}_2 (\Delta H = -393.5 \text{ kJ})$

$\text{CO} \rightarrow \text{C} + \text{O}_2 (\Delta H = +110.5 \text{ kJ})$

Sum:

$\text{CO} + \frac{1}{2}\text{O}_2 \rightarrow \text{CO}_2$

- Combine the reactions:

$\text{C} + \text{O}_2 \rightarrow \text{CO}_2$

$\text{CO} \rightarrow \text{C} + \text{O}_2$

Adding:

$\text{CO} + \frac{1}{2}\text{O}_2 \rightarrow \text{CO}_2$

Total ΔH :

$-393.5 \text{ kJ} + 110.5 \text{ kJ} = -283 \text{ kJ}$

Answer:

The enthalpy change for the reaction is approximately -283 kJ.

Question What is the primary focus of Chapter 11 in thermochemistry? Chapter 11 in thermochemistry primarily focuses on understanding heat transfer, enthalpy changes, and energy calculations associated with chemical reactions and physical processes. How do you calculate the enthalpy change for a reaction using Hess's Law? Hess's Law states that the total enthalpy change for a reaction is the sum of the enthalpy changes for individual steps, which can be added algebraically to find the overall ΔH for the reaction. What is the significance of calorimetry in thermochemistry? Calorimetry is used to measure the heat absorbed or evolved during a chemical reaction or physical change, allowing for the determination of enthalpy changes. How do bond energies relate to the calculation of reaction enthalpy? Reaction enthalpy can be estimated by subtracting the total bond energies of bonds broken from the total bond energies of bonds formed, following the bond energy method. What is standard enthalpy of formation, and why is it important? The standard enthalpy of formation is the change in enthalpy when one mole of a compound is

formed from its elements in their standard states. It is important because it allows for the calculation of reaction enthalpies using tabulated data. What role does entropy play in thermochemistry, particularly in Chapter 11? While thermochemistry primarily deals with heat and enthalpy, entropy measures disorder and randomness, and it becomes important when evaluating spontaneity and Gibbs free energy in chemical reactions. How can you determine whether a reaction is endothermic or exothermic from thermochemical data? If the ΔH for a reaction is positive, it is endothermic (absorbs heat). If ΔH is negative, it is exothermic (releases heat). What are the common units used in thermochemistry for energy changes? Common units include joules (J), kilojoules (kJ), calories (cal), and kilocalories (kcal), with joules and kilojoules being standard SI units. Why is understanding the answer key for Chapter 11 thermochemistry important for students? The answer key helps students verify their understanding of key concepts, practice problem-solving skills, and prepare effectively for exams by providing clear, correct solutions to thermochemistry questions.
